Bijlage 4 Toelichting aanpassingen naar definitieve versie

1 Inleiding

1.1 Aanleiding en doel

De gemeente Den Haag voert voor verschillende doeleinden verkeersanalyses en milieuberekeningen uit, onder meer in het kader van vragen van bewoners of ruimtelijke ontwikkelingen. Voor de analyses wordt gebruik gemaakt van verkeersintensiteiten. De gemeente Den Haag heeft hiertoe behoefte aan een dekkende en betrouwbare set van jaargemiddelde verkeersintensiteiten.

Antea Group stelt deze set van jaargemiddelde verkeersintensiteiten voor wegvakken in het areaal van de gemeente op. Hierbij wordt gebruik gemaakt van tellingen, het verkeersmodel V-MRDH, en diverse andere gegevensbronnen. Door deze informatie te combineren en vervolgens berekeningen uit te voeren, wordt een intensiteitenkaart voor het huidige jaar (2022) en het prognosejaar (2033) geproduceerd. **Vervolg van dit document: jaargang 2022**. De uiteindelijke set aan verkeersintensiteiten is transparant opgesteld en betrouwbaar.

Doel methodiekbeschrijving
Onderliggend document is de methodiekbeschrijving welke is toepast voor het opstellen van de intensiteitenkaarten voor Den Haag, jaren 2022 en 2033. Deze methodiekbeschrijving is een actualisatie van de methodiekbeschrijving uit de eerste cyclus van de intensiteitenkaarten.

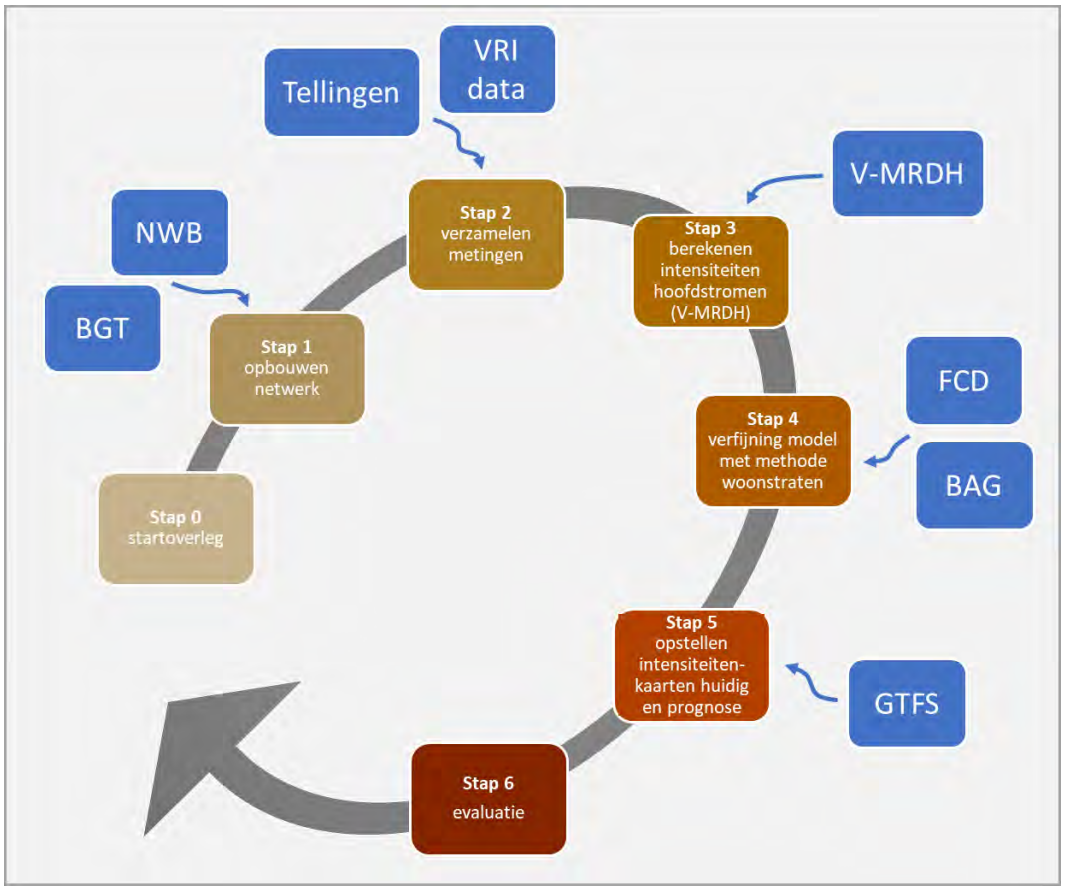
In deze methodiekbeschrijving is gedetailleerd beschreven welke stappen zijn uitgevoerd om uiteindelijk te komen tot de intensiteitenkaarten. Hierin zijn de uitgangspunten toegelicht, en zijn gemaakte keuzes verantwoord. Daarnaast zijn ook resultaten van tussenstappen en afwijkingen voor het lopende jaar van de intensiteitenkaarten opgenomen in dit document. Het uitgangspunt bij deze methodiekbeschrijving is dat aan de hand van onderliggende document en gebruikte bronnen en middelen, het productieproces transparant en reproduceerbaar is.

1.2 Hoofdstappen productie intensiteitenkaarten Den Haag

Deze methodiekbeschrijving is opgebouwd aan de hand van de 7 hoofdstappen voor de jaarlijkse productie van de intensiteitenkaarten voor Den Haag (zie Figuur 1, volgende pagina). De filosofie van de aanpak is dat er zo veel mogelijk gebruik gemaakt wordt van metingen. Daarnaast is er ook een verfijning toegepast om een betrouwbare inschatting te kunnen geven op kleinere wegen, waar het verkeersmodel minder betrouwbare resultaten geeft. De modelinschattingen en inschattingen door de verfijning zijn uiteindelijk ook terug te leiden op de metingen, aangezien het model op de metingen wordt gekalibreerd.

- In stap 0 start het proces met een startoverleg en worden de uitgangspunten en de planning bepaald.
- In stap 1 wordt het netwerk opgebouwd.
- In stap 2 worden de gemeten intensiteiten opgehaald en in het proces verwerkt.
- In stap 3 wordt het verkeersmodel V-MRDH gekalibreerd op de tellingen en toegepast om tot intensiteiten op de hoofdwegen te komen.
- In stap 4 wordt voor deelgebieden (kleinere wegen) de intensiteiten geschat middels een verfijningsmethodiek.

- Vervolgens worden in stap 5 de intensiteiten van de hoofdwegen en kleinere wegen samengevoegd. Dit product is de concept intensiteitenkaart. Op basis van de reactie van de gemeente worden de intensiteiten waar nodig bijgewerkt en definitief opgeleverd.
- Tot slot wordt in stap 6 het proces geëvalueerd.



Figuur 1 Jaarlijkse cyclus aanpak opstellen intensiteitenkaarten en de gebruikte bronnen (blauw)

2 Stap 0: startoverleg en voorbereiding

2.1 Omschrijving werkzaamheden

In de voorbereidingsfase is het proces begonnen met een startoverleg. In het startoverleg worden de volgende zaken besproken:

- Aanpak voor het opstellen van de intensiteitenkaarten;
- Planning van de werkzaamheden;
- Inhoudelijke bijzonderheden;
- Afspraken over eventuele verbeteringen in de aanpak n.a.v. een voorgaand jaar (niet van toepassing op het eerste jaar).

Op basis van het startoverleg is de aanpak en de planning definitief gemaakt. De data voor de vervolgoverleggen zijn vastgelegd.

Verder is in deze fase gecontroleerd of alle benodigde gegevens voor het opstellen van de intensiteitenkaarten beschikbaar zijn, zodat het proces met de juiste gegevens van start kan. De benodigde gegevens die door de gemeente Den Haag aangeleverd worden:

- De VRI-data van de gemeente Den Haag (via NDW);
- Wegvaktellingen die in het lopende jaar zijn uitgevoerd (Basec-export);
- De vigerende versie van het V-MRDH (voor dit jaar 2.10.2).

Het startoverleg wordt jaarlijks herhaald om (verkeerskundige) bijzonderheden te bespreken die van invloed zijn op de intensiteitenkaarten. Denk hierbij aan infrastructurele wijzigingen, updates in het V-MRDH, werkzaamheden die impact hadden op de intensiteiten, grote veranderingen in de stad of geconstateerde fouten in de vorige oplevering.

2.2 Bijzonderheden jaargang 2022

Op basis van de evaluatie van jaargang 2021 zijn er in de periode tussen de evaluatie en het startoverleg van de nieuwe jaargang afspraken voorbereid over de jaargang 2022. Hieronder vallen ook enkele quick wins en aanpassingen in de methodiek.

2.3 Resultaat jaargang 2022

De volgende inhoudelijke afspraken zijn gemaakt tijdens het startoverleg.

- Voor het huidige jaar en het prognosejaar wordt gebruik gemaakt van V-MRDH, versie 2.10.2.
- De betekenis van de kaarten is het volgende:
    - 2022: de intensiteiten zijn een weergave van de werkelijke situatie in 2022, waarbij dus ook invloeden van werkzaamheden (en het staartje van corona) zijn inbegrepen.
    - Het prognosejaar is 2033 (een jaar opgeschoven): deze intensiteiten worden gebaseerd op het 2033-scenario uit het V-MRDH. Voor het prognosejaar is een uitgebreid verbetervoorstel gemaakt en doorgevoerd. Dit wordt nader toegelicht in hoofdstukken 5 en 6.

- Afgesproken wordt een extra maand aan VRI-data mee te nemen in de intensiteitenkaart om een hogere betrouwbaarheid te hebben.
- Er zijn geen grote netwerkwijzigingen die aandacht nodig hebben voor jaargang 2022.
- Verbeteringen die voor de definitieve versie van jaargang 2021 zijn meegenomen (permanente telpunten, Basec-tellingen uit voorgaande jaren).

3 Stap 1: opbouwen netwerk

3.1 Omschrijving werkzaamheden

Basisnetwerk
De basis van het netwerk voor de intensiteitenkaarten is het Nationaal Wegenbestand (NWB). Ieder jaar wordt de vigerende versie van het NWB gebruikt, na een controle door Antea Group en ook de gemeente Den Haag op het conceptnetwerk. In het NWB van ieder jaar zijn in de basis de infrastructurele wijzigingen van het afgelopen jaar opgenomen, maar hier wordt dan ook in de controle aandacht aan besteed. Daarna volgt een geautomatiseerde bewerking zodat het netwerk routeerbaar is: het NWB kent in de basis namelijk maar 1 netwerklink voor beide richtingen, dit wordt omgezet naar een aparte link per rijrichting.

De intensiteiten worden berekend voor de NWB-links waarvoor aangegeven is dat deze in beheer zijn van de gemeente Den Haag[1], overige wegen worden uit het netwerk gefilterd. Dat geldt ook voor eventuele fietspaden en voetpaden die in het NWB zijn opgenomen.

Snelheid en wegdekverharding
Verder is er voor het NWB ook een koppeling beschikbaar met gegevens over de maximumsnelheid op wegvakken. Deze gegevens worden in het basisnetwerk opgenomen als input voor de milieuberekeningen. De milieuberekeningen maken daarnaast ook gebruik van informatie over de verharding van wegen. Deze informatie wordt onttrokken uit de Basisregistratie Grootschalige Topografie (BGT). In de BGT is de verharding van infrastructuur op vlakniveau opgenomen. Dit wordt gekoppeld aan links in het NWB door het verhardingsvlak te identificeren dat de meeste overlap heeft met de NWB-link.

De gegevens over wegdekverharding en snelheid worden eveneens steeksproefsgewijs gecontroleerd.

Definitie van deelgebieden
Voor de berekening van intensiteiten op de wegvakken van de gemeente Den Haag wordt in de methode onderscheid gemaakt tussen hoofdwegen - die het V-MRDH nauwkeurig kan inschatten - en kleinere wegen waar de verfijningsmethodiek wordt toegepast voor een ‘deelgebied’. De grens ligt in de regel bij gebiedsontsluitingswegen, en barrières als kanalen en spoorlijnen.

Voor het eerste jaar van de intensiteitenkaarten is de definitie van alle deelgebieden voor de gemeente Den Haag handmatig uitgevoerd, in jaargangen daarna wordt dit geactualiseerd. Alle kleinere wegen vallen dus in een deelgebied waarvoor de verfijningsmethodiek wordt toegepast. Bij het indelen van de deelgebieden zijn de volgende uitgangspunten gehanteerd:

- Een deelgebied wordt begrensd door geografische obstakels (gracht, spoor, etc.) of door ontsluitingswegen;

[1] Binnen gemeentegrenzen gemeente Den Haag en NWB-attribuut WEGBEHSRT = ‘G’ (gemeente)

- Het aantal *doorgangen*[2] wordt geminimaliseerd en doorgangen hebben naar verwachting hogere intensiteiten (hogere betrouwbaarheid FCD) of juist vrijwel geen intensiteiten;
- Deelgebieden zijn zo groot mogelijk;
- Er gaan zo min mogelijk doorgaande wegen (ontsluitingswegen) door een deelgebied.

Een voorbeeld van hoe dit in Den Haag uitpakt is opgenomen in Figuur 2.

Figuur 2 Voorbeeld van de begrenzing van deelgebieden (groene vlakken)

Voetgangersgebied

Bij het definiëren van de deelgebieden kwam voor jaargang 2021 vraag naar boven hoe er omgegaan moest worden met de voetgangersgebieden in het centrum van Den Haag. In die voetgangersgebieden rijdt bevoorradend verkeer, hulpdiensten en eventueel bestemmingsverkeer. In oktober 2021 is een telling van gemotoriseerd verkeer uitgevoerd op de drukste voetgangersstraat in Den Haag, namelijk de Grote Marktstraat. Tevens zijn er telgegevens van gemotoriseerd verkeer beschikbaar van Spui. Hieruit blijkt dat de grenswaarde

[2] Wegvakken op de grens van deelgebieden welke een verbinding bieden tussen het deelgebied en de rest van het netwerk.

van minimaal 1.000 mvt/etmaal (doorsnede) voor milieuberekeningen niet bereikt wordt op deze drukste wegen in het voetgangersgebied.

In overleg met de gemeente Den Haag is daarom besloten om bij alle wegen in het voetgangersgebied een intensiteit "< 1.000 mvt/etmaal" aan te geven in de intensiteitenkaarten. Door de definitie van het netwerk (op basis van NWB) is het mogelijk dat de grens tussen voetgangersgebied en volledig toegankelijke rijbaan enigszins afwijkt van de werkelijke locatie van de poller.

3.2 Bijzonderheden jaargang 2022

Deelgebieden vergroot
Naar aanleiding van de evaluatie van jaargang 2021, is geconstateerd dat sommige deelgebieden groter gemaakt kunnen worden om de kwaliteit van de intensiteitenkaart te verbeteren. Een aantal deelgebieden zijn daardoor samengevoegd, waardoor er 88 deelgebieden over blijven.

Correcties NWB
Er hebben (deels handmatige) bewerkingen plaatsgevonden op het NWB om dit werkbaar te maken voor het proces van de intensiteitenkaarten.

- Alle éénrichtingswegen in de gemeente zijn gecontroleerd op tekenrichting of dit klopt met het dat de richting van de weg aanduidt in het NWB. Waar nodig is een handmatige correctie uitgevoerd;
- Over een aantal links in het NWB kon geen (geautomatiseerde) duidelijkheid verkregen worden of het een voetpad, fietspad, of rijbaan voor gemotoriseerd verkeer betrof. Deze links zijn handmatig nagelopen, voetpaden en fietspaden zijn uit het netwerk verwijderd.
- Het NWB bevat veel dubbele wegvakken. Duplicaten zijn dus verwijderd.

In totaal gaat het om tientallen NWB-links die zijn aangepast. Deze aanpassingen worden ook in een volgend jaar meegenomen.

3.3 Resultaat jaargang 2022

Voor het jaar 2022 is het netwerk van jaargang 2021 als basis gebruikt, waarbij relevante verschillen tussen NWB versies 1-9-2021 en 1-9-2022 als nieuwe netwerkwijzigingen zijn verwerkt.

Vanuit de gemeente Den Haag zijn enkele reacties binnengekomen naar aanleiding van de beoordeling van het concept basisnetwerk. Deze input is verwerkt tot het definitieve basisnetwerk. Het basisnetwerk is vervolgens conform de beschreven stappen en bijzonderheden verwerkt tot een routeerbaar netwerk dat in vervolgstappen is gebruikt.

4 Stap 2: verzamelen metingen

4.1 Omschrijving werkzaamheden

Bij het opstellen van de jaarlijkse intensiteitenkaarten worden de volgende meetgegevens gebruikt, die in deze stap verzameld worden:

- **Floating Car Data**, aangeleverd door Be-Mobile (september 2022): het aantal passages in één representatieve maand van het jaar voor alle doorgangen tussen deelgebieden en hoofdwegen van de gemeente Den Haag. Ook voor andere relevante wegvakken binnen deelgebieden wordt deze FCD opgevraagd. De FCD wordt direct gekoppeld aan het basisnetwerk voor de bewerking in stap 4.
- **Periodieke wegvaktellingen**, die in de loop van het huidige jaar én de afgelopen vier jaren op het areaal van de gemeente Den Haag zijn uitgevoerd. Dus voor jaargang 2022 tellingen tussen 2018 en 2022.

  Deze zijn vanuit een export van Basec beschikbaar. De tellingen worden zo veel als mogelijk automatisch gekoppeld aan het netwerk van het V-MRDH (aangezien het V-MRDH op onder meer deze tellingen gekalibreerd wordt). Waar mogelijk zijn de tellingen zo veel mogelijk uitgesplitst naar de verschillende voertuigcategorieën en naar tijdsperiode (werkdag spitsperioden en restdag waar het V-MRDH ook mee werkt).
- **Permanente wegvaktellingen**, die in de loop van het huidige jaar op grote wegen in en rond Den Haag zijn uitgevoerd en via NDW beschikbaar zijn gemaakt. In de intensiteitenkaart wordt gebruik gemaakt van tellingen op toe- en afritten van de A4, de N211, de N14 en telpunten van de MRDH op de gemeentegrens van Den Haag (o.a. met Rijswijk).
- **VRI-data**, intensiteiten motorvoertuigen per koplus, geaggregeerd over het lopende jaar en met resolutie op uurniveau. Daarnaast is voor alle VRI's de technische tekening aangeleverd waarmee afgeleid kon worden welke koplussen horen bij welk wegvak. Voor ieder toeleidend wegvak van het kruispunt is de VRI-data handmatig gekoppeld aan het netwerk van het V-MRDH om vervolgens dit te benutten in stap 3, kalibratie op deze data.

4.2 Bijzonderheden jaargang 2022

Voor deze jaargang van het opstellen van de intensiteitenkaarten is de levering van de VRI-data door NDW nog niet volledig ontwikkeld. Daarom is de volgende aanpak gekozen, in overleg met de gemeente Den Haag, om tot zo veel mogelijk bruikbare cijfers voor de intensiteitenkaarten te komen:

- Voor alle Haagse VRIs is bij NDW data opgevraagd voor juni en november 2022 (beide maanden afzonderlijk)
- Indien beide maanden beschikbaar waren, zijn de tellingen gemiddeld over deze beide maanden (163 VRIs). Anders is de enige beschikbare maand gebruikt (40 VRIs).
- Indien er geen data beschikbaar was (34 VRIs), heeft de gemeente Den Haag gezocht naar andere maanden met beschikbare teldata. Dat betrof uiteindelijk 5 VRIs.
- De tellingen zijn onderworpen aan een kwaliteitstoets door ze te vergelijken met telwaarden uit 2021 en een vergelijking tussen juni en november 2022 onderling.

- Op basis hiervan heeft de gemeente Den Haag per aandachtspunt een reactie gegeven op de wijze waarmee met de tellingen omgegaan moet worden (telling 2021 gebruiken, afkeuren, specifieke maand gebruiken).

Aggregatie per signaalgroep en tak van de VRI
Per tak van het VRI-kruispunt is door NDW automatisch geïdentificeerd welke teldata van welke (combinatie van) lussen de telling per signaalgroep vormt. Op diverse locatie is deze koppeling onjuist gebleken (bijvoorbeeld vervuild door telling fietsers) en is dit handmatig gecorrigeerd.

Vervolgens zijn de tellingen per signaalgroep geaggregeerd per tak van het kruispunt en is dit gekoppeld aan het verkeersmodel ten behoeve van de kalibratie. Dit is handmatig uitgevoerd met behulp van technische tekeningen van de kruispunten, aangezien er voor meerdere VRIs uitzonderingen bestaan voor de nummering van koplussen.

Kwaliteitscontrole: schrappen tellingen
In deze en de volgende stappen is bij verschillende tellingen geconstateerd dat deze onjuist of inconsistent zijn en daarom verder niet meegenomen in de kalibratie van V-MRDH of het gehele verdere proces van het opstellen van de intensiteiten. In Bijlage 1 zijn deze bevindingen opgenomen.

4.3 Resultaat jaargang 2022

Per gegevensbron is hieronder weergegeven hoeveel data is opgenomen voor verdere verwerking in de intensiteitenkaarten:

- FCD: 2014 wegvakken
- Wegvaktellingen (periodiek en permanent): 1057 wegvakken
- VRI-data: 807 wegvakken

De gegevens zijn succesvol gekoppeld aan het V-MRDH netwerk (VRI-data, wegvaktellingen) en het basisnetwerk (FCD).

5 Stap 3: berekeningen in V-MRDH

5.1 Omschrijving werkzaamheden

Het V-MRDH model is in OmniTrans gebouwd. Ten behoeve van dit project is de informatie van dit model uit OmniTrans geëxporteerd (voor de basisvariant 2022), namelijk:

- Nodes, met informatie over vertragingen van de oorspronkelijke toedeling in de verschillende tijdsperioden (ochtendspits, avondspits en restdag)
- Links, met informatie over kosten, snelheid, capaciteit en oorspronkelijk toegedeelde intensiteit voor auto en vracht en de tijdsperioden
- Turns, met informatie over afslagverboden en vertragingen van de oorspronkelijke toedeling
- Matrices, voor de auto en vracht en de drie tijdsperioden.
- Constanten die reistijdvertraging naar I/C verhouding en de monetaire waarde van tijd beschrijven.

Al deze informatie is noodzakelijk om de toedeling van het V-MRDH in Visum zo goed als mogelijk na te bootsen. In Visum is het namelijk mogelijk de kalibratie met module *TFlowFuzzy* uit te voeren en ook het aanmaken van informatie voor deelgebieden te automatiseren.

De omzetting van het V-MRDH naar Visum is dusdanig opgezet, dat de toedelingsparameters in Visum telkens zijn gewijzigd om de best mogelijke match tussen de toedeling in OmniTrans en Visum te vinden. Met de best passende toedeling in Visum is vervolgens verder gewerkt. De variant 2022 wordt eerst gekalibreerd op de verzamelde Basec- en VRI-tellingen. De wegvaktellingen uit Basec worden geautomatiseerd gekoppeld aan het netwerk van het V-MRDH, voor de VRI's is de data handmatig aan het netwerk gekoppeld (ieder toeleidend wegvak voor ieder VRI-kruispunt).

Voor ochtendspits, avondspits en restdag zijn tellingen verzameld en opgenomen in het netwerk in Visum. De kalibratie verloopt in 2 stappen:

1. Eerst worden de intensiteiten voor auto en vracht gekalibreerd op de Basec-tellingen;
2. Vervolgens wordt het totaal hiervan (mvt) gekalibreerd op de VRI-tellingen (die geven geen informatie over verhouding personenauto's/vrachtverkeer).

Aan de kalibratie wordt een harde randvoorwaarde voor de bandbreedte rond de telling meegegeven. Dit zijn harde randvoorwaarden voor de kalibratie, maar de kalibratieprocedure zal altijd zo dicht mogelijk bij de tellingen willen zitten. De grootte van de bandbreedte is afhankelijk van de bron van de telling en de actualiteit daarvan. Permanente telpunten hebben de hoogste betrouwbaarheid (meeste meetdagen) en hebben de kleinste bandbreedte. Wegvaktellingen uit 2018 zijn beperkt actueel en kennen daardoor de grootste bandbreedte.

De kwaliteit van de kalibratie wordt getoetst door de modelwaarde op telpunten te vergelijken met de telling. Als hier weinig verschil tussen zit, spreekt men van een goede 'fit'. Dit wordt getoetst door middel van de GEH-waarde (statistische toets).

Aan de hand van jaargang 2021 is de methodiek voor het prognosejaar aangepast. Voor de hoofdstromen (wegen buiten deelgebieden) is er voor gekozen om de absolute groei tussen het huidig jaar en prognosejaar uit het oorspronkelijke V-MRDH (in OmniTrans te halen). Het verschil tussen toedelingsresultaten origineel V-MRDH in OmniTrans voor huidig jaar (2022) en

prognosejaar (2033) is ongewijzigd toegepast op de gekalibreerde resultaten voor het huidig jaar om tot het prognosejaar te komen.

5.2 Bijzonderheden jaargang 2022

In tegenstelling tot jaargang 2021, zijn in jaargang 2022 in het netwerk van het V-MRDH zijn geen fouten geconstateerd tijdens het proces van verwerking van de tellingen en resultaten.

In jaargang 2021 ging het voornamelijk om rijrichtingen van wegen. Een overzicht van de correcties van jaargang 2021 is voor de volledigheid opgenomen in Bijlage 2.

5.3 Resultaat jaargang 2022

De kalibratieresultaten (incl. GEH-toets) voor 2022 zijn gedeeld met de gemeente Den Haag en akkoord bevonden voor verwerking in de vervolgstappen.

De toedeling van de gekalibreerde matrices voor 2022 vormt een deelproduct voor intensiteiten op de wegen buiten deelgebieden. De toedeling is als input gebruikt voor de volgende stap, namelijk de verfijning in de deelgebieden.

6 Stap 4: verfijning voor kleinere wegen

6.1 Omschrijving werkzaamheden

Voor ieder wegvak in een deelgebied wordt een verkeersintensiteit berekend met de verfijningsmethodiek. Die methode zit als volgt in elkaar en wordt toegepast voor ieder deelgebied:

1. **Uitsmeren van de totale verkeersgeneratie van een modelzone over de subzones / wegvakken in die modelzone met behulp van BAG-data**. Subzones zijn gedefinieerd als elk wegvak binnen een deelgebied waaraan gebouwen kunnen liggen en verkeer de weg op en af kan[3]. Het uitsmeren van de verkeersgeneratie over de subzones vindt plaats op basis van de verblijfsobjecten uit de BAG die zich in een subzone (aan een wegvak) bevinden. Alle verblijfsobjecten in Den Haag worden toegedeeld aan het dichtstbijzijnde wegvak (en richting) en dus ook aan die specifieke subzone. De totale verkeersgeneratie van de modelzone wordt onder de subzones verdeeld, naar rato van de theoretische verkeersgeneratie (het geschatte aantal overdag aanwezige personen) van verblijfsobjecten van een subzone. Dus als een subzone 10% van de theoretische verkeersgeneratie in de hele modelzone bevat, wordt ook 10% van de modelverkeersgeneratie aan die subzone toegekend. Dit algoritme houdt rekening met de verkeersgeneratie van verschillende functies, verschil in oppervlakte en het onderscheid tussen personenauto's en vracht. Een winkelfunctie genereert meer vrachtverkeer dan een kantoorfunctie, terwijl bij woningen personenverkeer weer dominant is. De gebruikte conversiefactoren voor de relatieve verdeling van verkeer tussen BAG-verblijfsobjecten en subzones zijn opgenomen in Bijlage 3.

   Voor een aantal speciale modelzones geldt dat deze niet uitgesmeerd kunnen worden over een deelgebied. Denk aan parkeergarages of P+R terreinen, die een specifieke in- en uitgang in de ruimte hebben. Deze 'speciale zones' zijn aan de hand van de definitie in het V-MRDH geïdentificeerd: de verkeersgeneratie van deze zones wordt niet uitgesmeerd aan de hand van BAG-objecten en deze zones krijgen een speciale behandeling.

2. **Bepalen van HB-matrix voor alle subzones en doorgangen in iedere wijk**. Per subzone is het aandeel in de totale verkeersgeneratie van een modelzone berekend. We genereren in Visum voor ieder deelgebied een cordonmatrix, waardoor we weten wat de relaties zijn tussen modelzones en doorgangen. Ook doorgaand verkeer in een deelgebied wordt hierdoor beschreven. De verkeersgeneratie van 'speciale zones' (parkeren) wordt ook beschreven, maar wordt niet uitgesmeerd over subzones, de relaties met doorgangen blijft gelijk in de HB-matrix.

   Vervolgens worden de HB-relaties in de cordonmatrix uit het V-MRDH verdeeld aan de hand van de in de vorige substap berekende verhoudingen tussen subzones in een modelzone. De intensiteit tussen doorgangen onderling wordt niet uitgesmeerd (doorgaand verkeer). Het is nu dus bekend wat er vanuit het model geredeneerd per subzone aan verkeer gegenereerd wordt en hoe dat verkeer zich verdeelt over de doorgangen.

[3] Zeer korte wegvakken, zoals binnen en kruispunt of rotonde, vallen niet onder subzones.

3. **Toedelen van het verfijnde model in VISUM.** Het netwerk (routeerbaar NWB) binnen een deelgebied wordt naar VISUM overgezet, evenals de automatisch gegenereerde centroides en connectoren van de subzones, speciale zones en doorgangen. De HB-matrix uit de vorige substap wordt toegedeeld, waardoor de routes tussen de subzones en de doorgangen worden bepaald en gevuld met intensiteiten. Het toedelingsmechanisme houdt rekening met vertraging op afslagen (linksaf, rechtsaf) en de snelheden op wegvakken. Op elk wegvak en in het NWB bekende straat is er nu een verkeersintensiteit op werkdag etmaal-niveau voor auto en vracht. Enkel als zich geen verblijfsobjecten aan een wegvak bevinden, en het wegvak is geen onderdeel van een route tussen andere subzones en een doorgang, dan is het mogelijk dat een wegvak leeg blijft.

4. **Kalibreren van het verfijnde model in VISUM met behulp van tellingen en FCD.** Voor iedere doorgang, evenals enkele aanvullende wegvakken binnenin deelgebieden, is FCD verzameld. De FCD geeft aan hoeveel geregistreerde gebruikers gemiddeld per werkdag en weekdag etmaal van een wegvak gebruik hebben gemaakt. Dit is uiteraard niet dekkend voor de volledige verkeersintensiteit, maar geeft wel een goed beeld bij het relatieve gebruik van de doorgangen voor een deelgebied. Daarom worden de FCD-tellingen opgeschaald naar het totale in- en uitgaande verkeer op doorgangen per deelgebied. De verhouding tussen de som van intensiteiten op doorgangen uit het model en uit FCD wordt gebruikt om de FCD op te schalen. Dit is één schaalfactor, die op alle FCD-tellingen in het deelgebied wordt gezet.

   Er is in de eerste jaargang geconstateerd dat de FCD voor meerdere deelgebieden scheefheid bevat: er is in totaal meer ingaand verkeer dan uitgaand verkeer. Om te voorkomen dat dit de totale verkeersgeneratie van een deelgebied scheef trekt (maar ook de kalibratie daarvan niet vast loopt) is een extra stap toegevoegd aan het algoritme van de verwerking van FCD, die er voor zorgt dat de verhouding tussen doorgangen uit de FCD wordt onttrokken, maar niet de verhouding tussen ingaand en uitgaand verkeer.
   De in- en uitgaande doorgangen worden geïdentificeerd. Voor alle ingaande doorgangen wordt de som van de geschaalde FCD-tellingen genomen, evenals de som voor uitgaande doorgangen. Deze waarden worden vervolgens geschaald naar het gemiddelde van beide waarden, zodat de totale som van de ingaande en uitgaande doorgangen gelijk blijft, maar ook het totaal van ingaande en totaal van uitgaande doorgangen gelijk is getrokken.

   In het Visum-netwerk voor het deelgebied worden de FCD-tellingen toegevoegd, evenals andere (Basec-)tellingen die in het deelgebied zijn uitgevoerd. Met behulp van *TFlowFuzzy* wordt de verkeersgeneratie van het deelgebied (en de verdeling over de doorgangen) gekalibreerd op de waarnemingen. De toedeling van de gekalibreerde matrix is het eindresultaat van de verfijning voor deelgebieden. Deze wordt in de verdere productie van de intensiteitenkaarten verwerkt. Voor enkele deelgebieden is kalibratie niet mogelijk. In paragraaf 6.2.1 wordt dit nader toegelicht.

De verfijning van het prognosejaar is naar aanleiding van de evaluatie van de eerste jaargang aangepast. Voor deelgebieden wordt de absolute groei verkeersgeneratie zones tussen huidig jaar en prognosejaar (vanuit het oorspronkelijk V-MRDH zonder kalibratie huidig jaar) berekend. De productie en attractie van zones in deelgebieden (per wegvak) wordt conform deze absolute groei opgehoogd om tot de verkeersgeneratie in het prognosejaar te komen. Deze verkeersgeneratie wordt zonder kalibratie in het netwerk van een deelgebied toegedeeld.

6.2 Bijzonderheden jaargang 2022

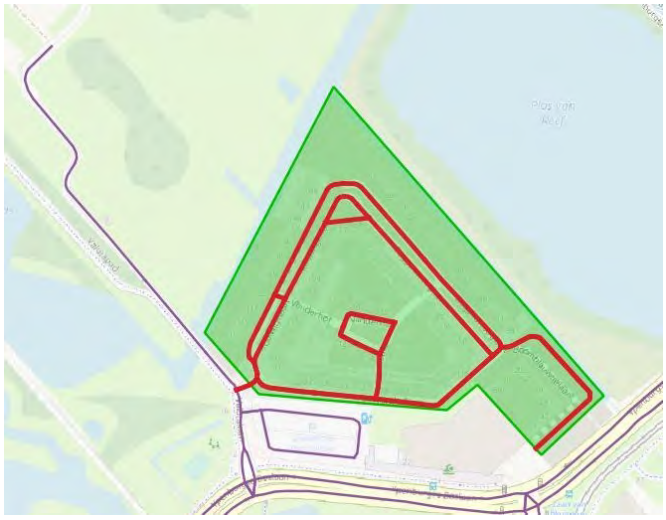
6.2.1 Niet-gekalibreerde deelgebieden

Bij het kalibreren van de verkeersgeneratie in de deelgebieden op de FCD-tellingen is voor een aantal gevallen geconstateerd dat de kalibratie op FCD-tellingen leidt tot onverklaarbare resultaten, of dat de kalibratie vastloopt op inconsistentie tussen FCD-tellingen, het netwerk en de verkeersgeneratie. In veel gevallen kan dit opgelost worden door specifieke FCD-waarden op bepaalde wegvakken of doorgangen te verwijderen. In een aantal andere gevallen is dit niet voldoende en is de algemene kwaliteit van de FCD (koppeling aan wegvakken of in aantallen) óf het netwerk (V-MRDH én basisnetwerk) in het deelgebied te matig om op te kalibreren. In dergelijke gevallen is de keuze gemaakt de kalibratie achterwege te laten, omdat de basistoedeling leidt tot betere resultaten dan kalibreren op twijfelachtige gegevens.

De keuze om niet te kalibreren is gemaakt voor deelgebieden 0, 80 en 84. Deze deelgebieden kennen alleen een toedeling van de uitgesmeerde HB-matrix. Bij de volgende deelgebieden is alleen FCD uitgesloten: 16, 17, 19, 28, 29, 30, 31, 33, 35, 39, 40, 44, 45, 59, 62, 64, 65, 66, 67, 68, 72, 73, 74, 76, 78, 79, 82, 85, 86. De FCD-kwaliteit is hier te laag: het betreffen vooral deelgebieden dicht bij het centrum van Den Haag. Deze hebben nog zeer veel doorgangen, waardoor de *steekproef* van de FCD te klein wordt en er daardoor niet-plausibele waarden ontstaan.

6.2.2 Overige bijzonderheden bij deelgebieden

Voor één deelgebied geldt dat het V-MRDH daar in 2022 en 2033 geen verkeergeneratie kent. Het betreft deelgebied 7, aan de rand van Ypenburg (zie Figuur 3). Omdat er hier geen informatie voor beschikbaar is, is dit deelgebied leeg gelaten in de uitvoer. Naar verwachting is de verkeersintensiteit in dit woongebied lager dan 1.000 mvt/etmaal.



Figuur 3 Ligging van deelgebied 7 en de wegen in het deelgebied

6.3 Resultaat jaargang 2022

Na verwerking van de bijzonderheden in het proces van de verfijning zijn de eindresultaten per deelgebied gereed gekomen. Deze zijn als input gebruikt in de laatste stap van het productieproces van de intensiteitenkaarten.

7 Stap 5: opbouw intensiteitenkaarten

7.1 Omschrijving werkzaamheden

In de laatste stap wordt alle ingewonnen informatie gecombineerd en verrijkt tot het eindproduct dat bruikbaar is voor afnemers vanuit de lucht- en geluidwereld. We volgen hierbij de volgende stappen, die hieronder nader worden toegelicht:

- Combineren van hoofdstomen en verfijnde netwerken tot één netwerk
- Verrijking voor milieuberekeningen
- Toevoegen openbaar vervoer aan de intensiteitenkaart

Combineren van hoofdstromen en verfijnde netwerken tot één netwerk
De verkeersintensiteiten op de hoofdwegen van Den Haag (buiten deelgebieden) worden onttrokken uit de toedeling van V-MRDH in Visum. Het netwerk van het V-MRDH correspondeert niet (altijd) met het NWB. Het netwerk van het V-MRDH is daarom (grotendeels automatisch) gekoppeld aan het basisnetwerk.

De berekende verkeersintensiteiten voor het verfijnde deel van de gemeente (binnen deelgebieden) zijn al direct toegedeeld op de het basisnetwerk. De resultaten hiervan worden 1-op-1 overgenomen in het eindproduct.

Het resultaat is voor zowel het huidige jaar één shape als het prognosejaar één shape, met daarin intensiteiten voor alle wegen in het beheer van de gemeente Den Haag. Het netwerk is gebaseerd op het NWB.

In de shape is eveneens opgenomen van welke bron de intensiteit afkomstig is:

1. Locatie permanente (VRI-)telling
2. Locatie periodieke (Basec-)telling
3. Intensiteit hoofdweg, modelresultaat gekalibreerd in V-MRDH
4. Intensiteit doorgang, modelresultaat gekalibreerd op FCD
5. Intensiteit verfijnd netwerk/deelgebied

Verrijking voor milieuberekeningen
Voor het gebruik van de verkeersintensiteiten in vervolgprocessen door afnemers van de milieudisciplines is het cruciaal om in de berekening van de intensiteitenkaarten de omzetting te maken naar de gegevens die voor milieumodellen noodzakelijk zijn, namelijk:

- Intensiteiten voor de weekdag;
- Voor de dagdelen (dag/avond/nacht)[4];
- Voor de voertuigcategorieën licht verkeer, middelzwaar verkeer en zwaar verkeer.

Het resultaat van de voorgaande stappen is dat er voor het hele netwerk een werkdag etmaalintensiteit is voor auto en vracht. De volgende stappen worden doorlopen om dit om te zetten naar weekdag intensiteiten, onderscheid naar dagdelen en nader onderscheid in vrachtverkeer.

[4] Dag: 07-19 h; Avond 19-23 h; Nacht: 23-07 h.

Voor wegvakken binnen deelgebieden wordt de werkdag/weekdag verhouding afgeleid uit de FCD-tellingen en toegepast op de berekende werkdagintensiteit, voor alle wegvakken in het deelgebied. Op basis van de verdeling dag/avond/nacht van de totale intensiteit op de dichtstbijzijnde twee VRI-tellocaties wordt de weekdag etmaal-intensiteit uitgesplitst naar dag/avond/nacht. De verhouding uit de VRI-tellingen wordt op alle wegvakken in het deelgebied toegepast. Voor de nadere onderverdeling van vrachtverkeer wordt informatie gebruikt uit het dichtstbijzijnde Basec-telpunt dat deze informatie bevat. Bij voorkeur wordt een telling uit het deelgebied zelf gebruikt. De verhouding uit de telling wordt op alle wegvakken in het deelgebied toegepast.

Wegvakken buiten deelgebieden worden nader verfijnd aan de hand van de factoren uit het meest nabijgelegen deelgebied.

Toevoegen openbaar vervoer
In het eindresultaat is eveneens opgenomen hoeveel bussen en trams gebruik maken van ieder wegvak, op werkdagen en weekdagen. Voor de weekdag is dit nader uitgesplitst naar dag, avond en nacht. Deze informatie is afkomstig uit openbare GTFS data[5], waarin de lijnvoering, haltes en frequentie van bussen en trams is opgenomen. De lijnvoering en routes via haltes koppelen wij aan het basisnetwerk. Vervolgens wordt op basis van de dienstregeling bepaald hoeveel trams en bussen er gemiddeld in de gevraagde perioden over het wegvak rijden. Deze informatie is als los attribuut in de intensiteitenkaart toegevoegd. De aantallen bussen zijn bij de intensiteiten voor licht vrachtverkeer inbegrepen.

Van concept naar definitief
Na het toevoegen van het openbaar vervoer aan de intensiteitenkaart, en een uitvoerige controle op afwijkingen (nulintensiteiten, sprongen in intensiteiten), wordt de intensiteitenkaart in concept opgeleverd aan de gemeente Den Haag. Op basis van deze opmerkingen worden er aanpassingen gedaan om tot de definitieve intensiteitenkaarten voor 2022 en 2033 te komen. De terugkoppeling op de reactie van de gemeente op de concept versie is opgenomen in Bijlage 4.

7.2 Bijzonderheden jaargang 2022

In het automatische resultaat van de koppeling tussen het netwerk van het V-MRDH en het basisnetwerk zijn meerdere handmatige correcties uitgevoerd. De automatische koppeling heeft voornamelijk moeite met wegvakken binnen kruispunten en rotondes: de netwerkmodellering van kruispunten is simpelweg anders in het NWB dan in het V-MRDH. In overleg met de gemeente Den Haag is afgesproken dat deze kruispuntwegvakjes niet cruciaal zijn voor de kwaliteit en daarom niet nader beschouwd worden in het eindresultaat.

7.3 Resultaat jaargang 2022

Het resultaat van deze stap is oplevering van de intensiteitenkaarten voor 2022 en 2033.

[5] General Transit Feed Specification

8 Stap 6: Evaluatie

In deze laatste stap wordt het gehele proces en de resultaten van intensiteitenkaarten Den Haag geëvalueerd in een overleg. In dit overleg worden mogelijke verbeterpunten besproken en vastgelegd voor een volgende cyclus van het produceren van de intensiteitenkaarten.

Bijlage 1 Bevindingen kwaliteitscontrole tellingen

Bijlage 1 Bevindingen kwaliteitscontrole tellingen

De kwaliteitscontrole door Antea Group en de gemeente Den Haag is vastgelegd in de volgende bestanden:

- *Voorbereiding kalibratie intensiteitenkaart 2022 – def.pdf*
- *DH_2022_Tellingen 22-21_opmerkingen DH.shp*
- *DH_2022_Tellingen nov-juni22_opmerkingen DH.shp*

Deze zijn op aanvraag beschikbaar.

Bijlage 2 Aanpassingen aan netwerk V-MRDH

Bijlage 2 Aanpassingen aan netwerk V-MRDH

Netwerkaanpassingen jaargang 2021:
De volgende rijrichtingen zijn in incorrect bevonden in het V-MRDH en aangepast:

- Linknr: 614107. Wijziging van eenrichtingsweg naar tweerichtingsweg
- Linknr: 39318, 39319, 39322, 39321, 55465, 55464, 55462, 55463. Rijrichting omdraaien.

Bijlage 4 Toelichting aanpassingen naar definitieve versie

Bijlage 4 Toelichting aanpassingen naar definitieve versie

In onderstaande tabel is de reactie vanuit de gemeente Den Haag op de concept intensiteitenkaarten opgenomen, evenals de aanpassingen om tot de definitieve versie te komen.

Opmerking gemeente Den Haag	Verwerking Antea Group
LV cijfers zeer laag in 2033	Bij de LV cijfers zijn per abuis MZV cijfers genoteerd in de concept kaart 2033. Aangepast.
Knip Waldorpstraat (thv station HS) ontbreekt	Knip toegevoegd in deelgebied voor 2022 en 2033
Voetgangersgebied/knip Zoutmanstraat ontbreekt	Knip toegevoegd in deelgebied voor 2022 en 2033
Schalk Burgerstraat is eenrichtingsverkeer (ri Zuid)	Rijrichting aangepast in deelgebied voor 2022 en 2033
Parkeerterrein Van der Kunststraat sluit ten onrechte aan op Calandstraat	Aansluiting aangepast in deelgebied voor 2022 en 2033
Checkvraag: zit linksafverbod Calandstraat - Waldorpstraat erin? Zowel 2022 als 2033	Linksafverbod toegevoegd in deelgebied voor 2022 en 2033
Wat gebeurt er halverwege Viaductweg? (westelijk deel grote afname in beide richtingen, deel thv spoor niet, terwijl het 1 weg is met een klein zijstraatje ertussen) Verdwijnende groei en wegvakken in kruispunten die wegvallen, zoals hier Hildebrandplein richting Erasmusweg	Geen aanpassing. Toelichting op mogelijke ruimtelijke inconsistentie ter hoogte van grenzen deelgebied besproken. Afspraak is dat Antea Group de grenzen voor deelgebieden intensiteitenkaart 2022/2033 aanlevert
Op de Oranjebuitensingel en Zwarteweg (vlakbij Centraal station) rijdt in werkelijkheid heel weinig verkeer, vrijwel alleen van parkeergarages. Intensiteiten van rond de 8000 mvt/etmaal in 2022 en 2033 zijn hier veel te hoog. Wat gaat er mis? Een afname van ca. 1000 mvt/etmaal op de Herengracht lijkt niet logisch…	Aansluiting van zones in deelgebied centrum handmatig gewijzigd om onlogische routes te voorkomen.
Vreemde afname bij de Megastores (Verheeskade). Hier verwachten we juist een toename	Een parkeergarage was in het deelgebied niet meegenomen, toegevoegd.
Er zit een soort 'groeistroom' op een vreemde locatie. Op de Leyweg/Genemuidenstraat moet een knip zitten. Als die goed in de kaart zit is de vreemde 'groeistroom' wellicht ook verholpen.	Knip toegevoegd in deelgebied voor 2022 en 2033
Wat op een paar plekken voor lijkt te komen: Binnen een woonwijk zie ik een soort uitwisseling van routes, zie Moerwijk-Oost. Groei en krimp op verschillende wegen zonder duidelijke verklaring. Is hier wel een verklaring voor?	Geen aanpassing, verbetermogelijkheid voor volgende cycli. In onze methode worden intensiteiten in de deelgebieden gekalibreerd op beschikbare tellingen. Dit is alleen voor het huidige jaar (2022), voor het prognosejaar is dit niet mogelijk. Door het ontbreken van tellingen in de 2033 versie, worden rijroutes niet gecorrigeerd waardoor er verschillen kunnen ontstaan. Moerwijk-Oost bevat zeer veel

	tellingen. De verschillen zijn hier naar verwachting het grootst van alle deelgebieden.
In intensiteitenkaart is nog een doorgaande route door het Haagse Bos. Die is er niet (ook 2022)	Knip toegevoegd in deelgebied voor 2022 en 2033
Er zijn een aantal wegvakken met dubbele ID's (10-20 ongeveer). Graag dit verder uitzoeken en oplossen.	Dubbele IDs zijn bij definitieve oplevering gecontroleerd en verwijderd.

Over Antea Group

Antea Group is het thuis van 1500 trotse ingenieurs en adviseurs. Samen bouwen wij elke dag aan een veilige, gezonde en toekomstbestendige leefomgeving. Je vindt bij ons de allerbeste vakspecialisten van Nederland, maar ook innovatieve oplossingen op het gebied van data, sensoring en IT. Hiermee dragen wij bij aan de ontwikkeling van infra, woonwijken of waterwerken. Maar ook aan vraagstukken rondom klimaatadaptatie, energietransitie en de vervangingsopgave. Van onderzoek tot ontwerp, van realisatie tot beheer: voor elke opgave brengen wij de juiste kennis aan tafel. Wij denken kritisch mee en altijd vanuit de mindset om samen voor het beste resultaat te gaan. Op deze manier anticiperen wij op de vragen van vandaag en de oplossingen voor morgen. Al 70 jaar.
