Gevolgklasse: **CC 1**

Ontwerplevensduur klasse: **3** in jaren: **50**

Omschrijving constructieprincipe

De nieuwbouw woning wordt voorzien van een zadeldak dat is opgebouwd uit zelfdragende dakplaten die als gordingelementen over de stalen spanten worden aangebracht.

De verdiepingsvloer bestaat uit een breedplaatvloer die wordt gedragen door betonstenen wanden. De binnenwanden op de verdiepingsvloer worden uitgevoerd als lichte scheidingswanden.

De fundering bestaat uit een zogenaamde plaatfundering.

De stabiliteit van de woning wordt bewerkstelligd door een veelheid aan gefundeerde metselwerk wanden die in beide richtingen in voldoende mate aanwezig zijn. De verdiepingsvloer zal dan als een schijf werken om de horizontale belastingen uit het dak over te brengen naar de fundering. De stalen spanten worden uitgevoerd met momentvast verbindingen. Op de dakplaten wordt bandstaal geschroefd om ook de stabiliteit in de langsrichting van het dak te waarborgen.

Metselwerk

Dragend metselwerk als **betonsteen** met een perforatievolume **< 25%**

Genormaliseerde druksterkte is **15 N/mm²** met een morteldruksterke **M5**
 $f_k = 5,22 \text{ N/mm}^2$ $f_d = 3,48 \text{ N/mm}^2$

Uitgezonderd van constructieve dilataties in het metselwerk worden de noodzakelijke (knip)voegen door de metselwerk leverancier aangegeven. Laat u hierin adviseren door de aannemer of metselwerkleverancier.

Houtconstructie

Indien niet anders vermeld alle houten onderdelen uitvoeren in C24.

Alle houten balken die dragen in een stalen profiel koppelen dmv. een opgelast schotje d=4 + 2M8 houtdraadbout.

Het beschot dient te worden uitgevoerd als een 'schijf'. Derhalve dienen de platen te worden aangebracht in een zogenaamd 'halfsteens verband' en te worden geschroefd op de houten balklaag met schroeven $\varnothing 4,5$ hoh 200 mm.

Staalconstructie

Stalen onderdelen die in contact komen met een vochtig milieu worden allen thermisch verzinkt.

Alle stalen lateien en liggers dienen minimaal 150 mm te worden opgelegd in het metselwerk (tenzij anders aangegeven)

Staalkwaliteit S235 tenzij anders aangegeven.

Toe te passen boutkwaliteit: 8.8 en toe te passen ankerkwaliteit t.p.v. voetplaten: 4.6

Voetplaten en opleggingen dienen altijd volledig te worden ondersabeld met een krimparme mortel kwaliteit K50.

Ondergrond

De nieuwbouw wordt gefundeerd op staal conform funderingsadvies Aelmans E230296.003 GEO d.d. 22-2-2023.

De volgende uitgangspunten zijn uit de rapportage overgenomen:

Plaatfundering toepassen op een grondverbetering.

Aangenomen bouwpeil: 143,00 m +NAP

Ontgravingsniveau t.b.v. grondverbetering: 141,70 m +NAP

Beddingsconstante: 5400 kN/m3

Toelaatbare grondspanning: 91 kN/m2

B.G:7 Wind van links overdruk C

Diagram illustrating the wind load distribution (B.G:7 Wind van links overdruk C) on a roof structure. The structure consists of a horizontal section and a sloped section. The wind load is applied perpendicular to the windward face of the roof.

The diagram shows the following load values:

- Horizontal section peak load: 2.511
- Sloped section peak load: 1.569
- Fixed support reactions: 0.628 (at both ends)

The diagram also shows the distribution of wind pressure along the roof edges, with values ranging from 0 to 1.1.

Diagram of a Z-shaped beam under a distributed load. The beam has three segments: a horizontal segment of 1.0m, a vertical segment of 1.0m, and a horizontal segment of 1.0m. A distributed load of 1.0 kN/m is applied perpendicular to the beam. The beam is supported by a pin support at the left end and a roller support at the right end. The diagram shows the internal forces and moments along the beam.
