Liganda

A ligand is a molecule or ion that binds to a metal center.

The following are common types of ligands:

- Monodentate ligands: bind to the metal center through one donor atom.
 - Examples: H_2O , NH_3 , Cl^- , F^- .
- Bidentate ligands: bind to the metal center through two donor atoms.
 - Example: Ethylenediamine (en).
- Polydentate ligands: bind to the metal center through multiple donor atoms.
 - Example: EDTA (Ethylenediaminetetraacetic acid).

The coordination number of a metal complex is the total number of bonds between the metal and the ligands.

Common coordination numbers include 2, 4, and 6.
